COMET P/2007 T2 (KOWALSKI)

R. A. Kowalski reports his discovery of a comet on Catalina Sky Survey images taken with the 0.68-m Schmidt telescope (discovery observation tabulated below), the twilight images showing a coma 15'' across. Follow-up 30-s exposures by E. Beshore with the Mt. Lemmon 1.5-m reflector on Oct. 10.5 UT show a bright, elongated nuclear condensation and a tail $\approx 20''$ long in p.a. $\approx 300^\circ$. After posting on the Minor Planet Center's 'NEOCP' webpage, G. Sostero and E. Guido (Remanzacco, Italy, 0.45-m $f/4.4$ reflector) write that 70 co-added 30-s images from Oct. 10.13–10.16 show a concentrated coma with a diameter of nearly 18'' of total mag ~ 16.3 , elongated toward the northwest, with a narrow tail extending nearly 15'' toward p.a. 300° . L. Buzzi (Varese, Italy, 0.60-m $f/4.6$ reflector) reports that, on his images from Oct. 11.2, the object is elongated 10'' in p.a. 310° . D. T. Durig (Sewanee, TN, U.S.A., 0.30-m $f/3$ Schmidt-Cassegrain reflector) notes that twenty stacked 2-min images taken on Oct. 11.4 show a 15''–17'' coma that is asymmetrical in p.a. 310° . J. E. McGaha (Tucson, AZ, U.S.A., 0.62-m $f/5.1$ reflector) adds that his 120-s images from Oct. 11.48 show a 6'' coma that is elongated toward a short 8'' tail in p.a. 305° .

2007 UT	α_{2000}	δ_{2000}	Mag.
Oct. 9.50984	10 ^h 05 ^m 54. ^s 70	+22°37'06. ⁵	16.9

The available astrometry, the following preliminary elliptical orbital elements, and an ephemeris appear on *MPEC* 2007-T76.
