COMET C/2007 T6 (CATALINA)

An apparently asteroidal object discovered by the Catalina Sky Survey (discovery observation tabulated below), and posted on the Minor Planet Center's 'NEOCP' webpage, has been found to show cometary appearance by J. W. Young on his CCD frames taken on Oct. 14.5 UT with the Table Mountain 0.61-m *f*/16 Cassegrain reflector, which show a slightly elongated coma, 8'' × 12'' in diameter, with a short, faint 20'' tail in p.a. 310° (the coma being elongated perpendicular to the p.a. of the tail, more visible in short exposures). Young's exposures from Oct. 15.5 show the elongated, bright coma (mag 17.2), with size and orientation of elongation the same as seen on the previous night, but now with no hint of tail.

The available astrometry, the following preliminary parabolic orbital elements, and an ephemeris appear on *MPEC* 2007-T115.
